Richmond Hill Manlift Certification

Richmond Hill Manlift Certification - The Manlifts and Elevated Platforms program offers training on the rules, regulations and correct application of safe operating procedures and work practices involved in everyday activities for individuals who work utilizing this equipment. The course has been designed for people who are actively involved in these activities or those who have a basic knowledge of this machine.

manlifts and aerial platforms have become integral and common machinery in industrial settings during the last few decades. These equipment provide an easy way to lift staff close to what should be carried out on a stable platform apparatus, enabling workers to do tasks with greater comfort and safety rather than being perched on top of scaffolding or ladders.

Similar to every other tool, manlifts are only safe when they are used properly. As they lift staff above floor or ground level, accidents could easily happen and this can result in serious death or injuries for both the operators of the manlift as well as whoever passerby who might be unlucky enough to be standing underneath.

Manlifts come in various models. Most fit into 1 or 2 categories: the scissor lift, that is capable of moving up and down and the articulating boom lift, which can move both horizontally and vertically.

Protecting Staff

Proper training is vital in regard to safety matters. A lot of the businesses that rent manlifts will provide training at the jobsite. Every worker who would be working on the machine or operating it must receive training in safe operations. It is likewise vital that just those employees who have received training must be authorized to operate the controls. Communication rules and operating procedures should be clear. Therefore, staff on the ground should not operate controls without the knowledge and approval of any staff inside the basket.

Those employees who will be occupying the basket are required to wear proper fall protection such as lanyard and a harness. That protection should be attached to the manlift itself and not to a surface nearby. The employee should make certain that he or she has made any adjustments required to reflect the change in fall distance if there are changes in the height of the work area.

Manlifts should be tested and inspected every day to make certain they are in safe operating condition. Prior to utilizing the machine, whatever defects should be re-inspected and fixed.
